 <p>WHITE FLOWER</p>	 <p>BIRD</p>	 <p>ANT</p>
 <p>YELLOW FLOWER</p>	 <p>BEE</p>	 <p>LEAF</p>

WHAT IS POLLINATION?

Pollination is an important stage in the life cycle of flowering plants.

During this process, pollen is carried from one flower to another of the same species.

Pollinators collect and transfer pollen, which is necessary for the reproduction of flowers, fruits, and vegetables!

POLLINATOR FACTS

- Over 200,000 species of animals are pollinators! Hummingbirds, bats, beetles, bees, and butterflies are all pollinators.
- Worldwide, approximately 1,000 plants grown for food, beverages, and fibers, spices, and medicine need to be pollinated by animals.
- Pollinators help produce many foods and beverages, like blueberries, chocolate, coffee, melons, peaches, pumpkins, vanilla, and almonds.

Print out this Scavenger Hunt Card and visit the Streetsville Pollinator Showcase Garden at 280 Queen St S.

Find at least SIX items in the Scavenger Hunt!

Submit your Scavenger Hunt Card in our mailbox to be entered in our prize pack giveaway!
